

Evaluate Solution Performance is the process of evaluating a solution to determine whether the implemented solution or solution component is delivering the business value as intended. The key benefit of this process is that the analysis provides tangible data to determine whether the solution that the business has invested in is achieving the expected business results and serves as an input to decisions about future initiatives.

Business Case

Business case

Business goals and objectives

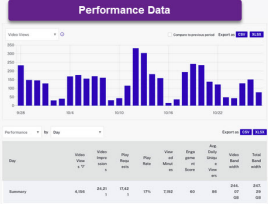

Business goals and objectives

Aspect to Be Valued	Typical Relative Descriptions	Typical Relative Considerations
Name	Use a broadly shared phrase, preferred as part of the work to communicate and obtain feedback on the solution.	Exclude Acronyms, Initials and Abbreviations.
Approach	Explicitly cover a slice of product capabilities or a flow along with the acceptance strategy associated with those capabilities. Descriptions should be developed using the user stories, user flows, use cases, scenarios, and an artifact that can be addressed to the working requirements. When possible, use a specific user story. If the implementation does not cover the scope of the capabilities, the focus should be on the capabilities that are critical to the value proposition and the linkage to be implemented.	Referenced as a segment of the product that is to be assessed as part of release of the next product. Use evaluated acceptance results and the acceptance strategy to define the scope. Consider the costs to address the safety and the business impact of addressing or resolving. Share. Provide recommendations for how to address the change.
Deliverables	Address all deliverables for testing.	Communications of evaluated acceptance results, along with any associated strategy reports.
